

ABSTRACT

An ATM currency cassette (208) includes a plurality of movable cassette information indicator buttons (214). Each button can be rotated about an axis for repositioning. The buttons can be axially moved outward and inward relative to the cassette housing (210) by rotation thereof. Different axial arrangements of the buttons represent respective different characteristics of cassette content. The cassette can be inserted into an ATM where the button positions can be read by the ATM. The cassette enables unused buttons to remain therewith and also permits a button arrangement to be changed without requiring opening of the cassette.

ABSTRACT

An ATM network includes a plurality of ATMs. Each ATM can determine the amount of currency in its currency cassettes. The network can track the amount of currency therein. The information can be provided in real time, enabling a network operator to provide efficient currency management.
